1. Thirty likely topics

State commissions favour topics that are (a) current, (b) morally serious, and (c) answerable by a well-read non-specialist. Below, grouped by theme.

Topics marked ★ are Nagaland/North-East specific — these are the ones almost nobody prepares, and a state commission is the one body most likely to set them.

A. Technology and society

1. Artificial Intelligence: opportunity or threat?
2. The digital divide in India — has technology widened inequality?
3. Social media: a tool of empowerment or of misinformation?
4. Cyber security and the safety of the ordinary citizen
5. Can e-governance make administration more accountable?
6. ★ Digital connectivity in the North-East: infrastructure as the first frontier

B. Governance and administration

7. Good governance: what does it mean in practice?
8. Corruption — causes, consequences and remedies
9. Decentralisation and grassroots democracy in India
10. Transparency and the Right to Information
11. The role of the civil servant in a developing democracy
12. ★ Article 371A and the balance between customary law and modern administration

C. Environment and climate

13. Climate change and India's development dilemma
14. Sustainable development: reconciling growth and ecology
15. Deforestation and the loss of biodiversity
16. Waste management in Indian towns and cities
17. ★ Jhum (shifting) cultivation in the North-East: tradition, ecology and livelihood

D. Nagaland and the North-East

18. ★ Nagaland at sixty: achievements and challenges
19. ★ Unemployment among the educated youth of Nagaland
20. ★ Tourism as an engine of growth for Nagaland
21. ★ The Act East Policy and the North-East's place in it

India and for a region like the North-East, and finally the shape a sensible regulatory response might take.

Artificial intelligence is not a single invention but a family of techniques by which computers improve their performance at a task by learning from data rather than by following instructions written out in advance. The idea is old; what is new is the combination of very large datasets, cheap computing power and improved learning methods. Where earlier waves of automation replaced muscle, this one substitutes for certain kinds of judgement. That is why its social consequences are harder to predict than those of the steam engine or the assembly line.

The opportunity is real and, in a developing country, unusually large. India suffers from a chronic shortage of specialists rather than of people. There are too few doctors for its villages, too few trained teachers for its classrooms, and too few technical staff for its courts and offices. Artificial intelligence does not remove the need for these professionals, but it can extend their reach. A trained system that flags suspicious images can allow one radiologist to screen many more patients. A translation system can deliver a government scheme's terms in a language the applicant actually speaks — a matter of real consequence in a country with twenty-two scheduled languages and hundreds more in daily use. In agriculture, forecasts based on local weather and soil data can help a farmer decide when to sow. These are not futuristic scenarios; they are extensions of what already works.

Against this stands the question of employment, which is the anxiety most often voiced and the one least well understood. Automation has historically destroyed particular jobs while creating others, and the net effect over a century has been more employment, not less. But the transition is neither automatic nor painless, and it is not distributed evenly. The Indian services sector, which absorbed a generation of educated young people into routine data and support work, is precisely the kind of employment that current systems perform competently. A young graduate whose skill was the accurate processing of routine information now competes with a machine that does it faster. The remedy is not to obstruct the technology, which is impossible, but to change what education produces — and India's record on retraining adults in mid-career is weak.

A second and subtler risk is the question of fairness. A learning system reproduces the patterns in the data it is given. If historical hiring records reflect prejudice, a system trained on them will reproduce that prejudice while wearing the appearance of objectivity — which makes it harder, not easier, to challenge. When such systems are used in policing, in credit, or in the allocation of welfare, the consequences fall hardest on those least able to appeal. There is also the matter of privacy: these systems are hungry for personal data, and India's framework for protecting it is still maturing. A decision made by a machine that cannot explain itself sits uneasily with the principle, fundamental to administrative law, that a citizen is entitled to reasons.

The regional dimension deserves particular attention. In Nagaland and the wider North-East, the promise of artificial intelligence is bound up with a prior problem: connectivity. A technology delivered over the internet is useless where the internet is intermittent, and hill terrain makes networks expensive to build and easy to lose. There is therefore a real danger that a technology capable of narrowing the gap between a metropolitan hospital and a district one will instead widen it, simply because the infrastructure arrives late. At the same time the region has assets that matter here: a young, English-educated population well placed to work in software services, and a linguistic diversity that makes it an important place for language technology if that work is done with, rather than merely about, local communities. Whether artificial intelligence helps or hurts the North-East will be settled less by the technology than by investment in fibre, electricity and skills.

What follows for policy? Three things, none of them exotic. First, regulation should

attach to the *use* rather than to the technology: a system that decides on a loan or a criminal charge should be held to standards of explanation and appeal, whoever built it. Second, education must shift from the transmission of retrievable information — which machines now supply on demand — towards judgement, communication and the ethical handling of problems, which they do not. Third, public investment should go where the market will not: rural connectivity, Indian-language datasets, and the retraining of workers whose jobs change under them.

Artificial intelligence, then, is best understood as a mirror with a magnifying glass attached. It reflects the priorities of the society that builds it and enlarges the consequences. A country that deploys it to widen access to medicine and schooling will find it an extraordinary opportunity; one that deploys it without rules, in an environment of unequal infrastructure and weak accountability, will find it deepening divisions it already has. The technology will not choose between these outcomes. We will.

(≈940 words)

Why this scores

Move	Where	Effect
Concrete historical hook — Turing, 1950	¶1 line 1	Avoids "in this modern era of...". Signals reading.
Explicit thesis sentence	¶1: "...is an amplifier..."	The examiner can point to your argument. Worth 2 marks on its own.
Roadmap sentence	end of ¶1	Tells the examiner the essay is planned.
Definition paragraph	¶2	Shows you know what you are talking about before you evaluate it.
PESTLE in action	¶3 Social, ¶4 Economic, ¶5 Legal/Ethical, ¶6 Regional, ¶7 Political	Six lenses, six paragraphs. This is the framework doing the work.
Balance — the "however"	¶4 opens " <i>Against this stands...</i> "	Two-sided treatment. Never a rant.
Nagaland paragraph	¶6	The differentiator. Almost nobody does this.
Facts that cannot be wrong	"twenty-two scheduled languages"	A safe, checkable constitutional fact. No invented statistics anywhere.
Concrete way-forward	¶7, numbered "First... Second... Third..."	Specific, actionable, not "the government should take steps".
Conditional optimistic close	last ¶	Mature. Ends on an image ("mirror with a magnifying glass") and a short punch line.

Model Essay 2 — Nagaland at Sixty: Achievements and Challenges

(Theme: Nagaland / North-East · ~890 words · Skeleton B)

Nagaland became the sixteenth State of the Indian Union on 1 December 1963, the first state in the North-East to be carved out after independence and, at the time, an experiment whose outcome no one could be confident of. Six decades later the experiment has produced a society with near-universal literacy by regional standards, a constitutional settlement unlike any other in the country, and a young population better educated than its parents. It has also produced persistent unemployment, a narrow economy and an infrastructure deficit that constrains almost everything else. This essay argues that Nagaland's central achievement has been political and cultural —

the preservation of a distinct identity inside a federal union — and that its central unfinished task is economic. It considers the constitutional foundation, the social gains, the economic constraints, and what a realistic path forward might look like.

The state's foundation is unusual and worth understanding precisely. Statehood followed the Sixteen Point Agreement between the Naga People's Convention and the Government of India, and was accompanied by the insertion of **Article 371A** into the Constitution by the Thirteenth Amendment in 1962. Under that article, no Act of Parliament applies in Nagaland in respect of the religious or social practices of the Nagas, Naga customary law and procedure, the administration of civil and criminal justice involving decisions according to customary law, or the ownership and transfer of land and its resources, unless the Legislative Assembly of Nagaland resolves that it shall. Few provisions in the Indian Constitution grant a state legislature so direct a veto. Its existence is why customary institutions — village councils, community land holding, traditional dispute resolution — have survived not as folklore but as functioning law.

That constitutional space has produced real social achievement. Literacy in Nagaland is high by national standards, and the participation of women in education has been substantial. The state has an unusually dense fabric of community institutions: village councils that command genuine authority, church-based organisations with wide reach, and village development boards through which local decisions about small assets are actually taken locally. The most distinctive expression of this is the state's **communitisation** policy — the Nagaland Communitisation of Public Institutions and Services Act, 2002 — under which the management of primary schools, health centres and electricity distribution at village level was transferred to community committees.

The idea that a village should own the school it sends its children to is not a slogan here but a statute. It is a genuine contribution to Indian administrative thinking and deserves to be better known outside the region.

Culturally, the state has managed something that has eluded many places: it has made tradition legible to outsiders without hollowing it out. The Hornbill Festival, held annually at Kisama near Kohima, has grown from a state initiative into the region's best-known cultural event, drawing visitors from across India and abroad. It has given the sixteen recognised tribes a shared platform without dissolving what distinguishes them. Whatever one thinks of the tension between performance and authenticity, the festival has done more for the state's external image than any publicity campaign could have.

The challenges are, by contrast, stubbornly economic. Nagaland's economy remains narrow. Agriculture, much of it still practised as jhum or shifting cultivation on hill slopes, supports a large share of households at low productivity. Manufacturing is minimal. The organised sector is dominated by government employment, which is finite and already saturated, and this single fact explains a great deal about the state's social anxieties. Each year the colleges produce graduates whose ambitions were formed around a government job that no longer exists in sufficient numbers, and the result is educated unemployment — a form of unemployment that is politically and socially more combustible than the ordinary kind. Terrain compounds everything: roads are expensive to build and are cut by the monsoon, which raises the cost of every good that enters or leaves the state and quietly taxes every business.

What, realistically, is the way forward? First, connectivity must be treated as the precondition for everything else rather than as one sector among many; road, rail, air and digital links determine whether any other policy can work. Second, the state's comparative advantages should be taken seriously rather than romanticised. Horticulture and organic produce, bamboo, tourism and the services sector — the last of which depends on educated English-speaking youth and reliable bandwidth rather than on factories or ports — are the plausible growth areas for a landlocked hill state. Third, education must shift its centre of gravity from preparing candidates for examinations

to preparing them for enterprise, which means vocational training and access to credit, not exhortation. Fourth, the **Act East Policy** gives the region a strategic role as India's land bridge to South-East Asia; Nagaland's border with Myanmar is an asset only if trade infrastructure and security are addressed together.

At sixty, Nagaland's record is therefore genuinely mixed, and honestly so. It has protected what it set out to protect: land, custom, identity, and a form of local democracy that most of India talks about and few practise. What it has not yet built is an economy capable of employing the confident, literate generation those institutions produced. The task of the next decade is not to choose between tradition and development — that framing has always been false here — but to make the state's distinctive institutions the instrument of its development rather than a consolation for the lack of it.

(≈890 words)

Why this scores

Move	Where	Effect
A precise, checkable opening fact	1 Dec 1963, sixteenth state	Immediate authority. Not a vague generalisation.
Balanced thesis stated outright	¶1: achievement political/cultural, unfinished task economic	Gives the essay a spine and a built-in structure.
Constitutional detail with the right keywords	¶2, Art. 371A, four protected subjects	This is exactly what a Nagaland examiner is looking for. Doubles as GK revision.
A distinctive, under-used example	Communitisation Act, 2002	Shows genuine local knowledge. Very few candidates will have this.
Cultural paragraph with a real institution	Hornbill Festival, Kisama	Concrete, verifiable, regional.
Honest treatment of problems	¶5, educated unemployment	Not defensive, not despairing. Examiners reward candour.
Numbered, concrete way forward	¶6	Four specific levers, each tied to a stated constraint.
Reframing conclusion	last ¶: rejects the "tradition vs development" binary	Refusing a false dichotomy is the single most reliable way to sound mature.
No invented statistics anywhere	throughout	"high by national standards", "a large share" — qualitative, safe, unfalsifiable.

Model Essay 3 — *Climate Change and India's Development Dilemma*

(Theme: environment · ~880 words · Skeleton B)

India occupies an uncomfortable position in the world's climate arithmetic. It is among the countries most exposed to the physical consequences of a warming planet — a long coastline, a monsoon-dependent agriculture, Himalayan glaciers feeding its northern rivers — and simultaneously a country whose per capita energy use remains far below the levels the industrialised world has long taken for granted. To ask India to constrain its emissions is to ask a country still lifting hundreds of millions of people out of poverty to accept a limit that no wealthy nation accepted while it was growing. This essay argues that the apparent conflict between development and climate action is real in the short term but false in the long one, and that India's interest lies in leading the transition rather than resisting it. It considers the nature of the exposure, the

equity argument, the economic case for early action, the regional dimension in the North-East, and the institutional steps required.

The physical exposure comes first because it is not a matter of opinion. Indian agriculture remains substantially rain-fed, and the monsoon is the single variable on which the rural economy turns. A warming atmosphere holds more moisture, which tends to concentrate rainfall into fewer, heavier events — more flood, more drought, less of the steady rain that crops need. Sea-level rise threatens coastal cities and the agricultural deltas behind them. Retreating glaciers alter the flow of rivers on which the northern plains depend. Heat itself is a direct threat: outdoor labour, which is how a large part of India earns, becomes dangerous above certain temperatures. These are not distant projections but processes already underway.

Against this, the equity argument retains its force and should not be abandoned out of embarrassment. The stock of greenhouse gases now in the atmosphere was placed there overwhelmingly by countries that industrialised first. India's per capita emissions remain well below the global average. The principle of **common but differentiated responsibilities**, embedded in international climate agreements, exists precisely to recognise this asymmetry. A poor country that has contributed least to a problem cannot reasonably be asked to bear the largest share of the cost of solving it, and India is right to insist on finance and technology transfer as the condition of ambition.

Yet equity is an argument about *who pays*, not about *whether to act* — and here the economic case has changed decisively. For most of the last century, cleaner energy meant costlier energy, and a developing country choosing it accepted slower growth. That trade-off has weakened. The cost of solar generation has fallen dramatically over the past fifteen years, and India, with high solar irradiance across much of its territory, is unusually well placed to benefit. There is also a balance-of-payments argument that has nothing to do with the climate at all: India imports a large share of the crude oil it consumes, and every unit of energy generated domestically from sun or wind is a unit not purchased in foreign currency. Energy security and decarbonisation point in the same direction, which is a fortunate and unusual alignment. Add to this the health cost of air pollution in Indian cities — measured in illness and lost working days — and early action begins to look less like a sacrifice than an investment.

The North-East illustrates both the stakes and the complications. The region carries a large share of India's remaining forest cover, and its watersheds feed the Brahmaputra system on which Assam's agriculture depends. Its hills are geologically young, heavily rained upon and prone to landslides, so intensified rainfall translates quickly into destroyed roads and isolated villages. At the same time, the region's people are asked to conserve forests whose benefits — carbon storage, water regulation, biodiversity — are enjoyed nationally while the cost of foregone livelihood is borne locally. Any serious climate policy must therefore include payment for these services, in the form of compensatory transfers and support for alternatives to shifting cultivation that are attractive rather than merely mandated. Conservation that ignores the household economy of the conserving community does not last.

What should be done? Four measures stand out. First, accelerate the shift to renewable generation while investing seriously in storage and grid capacity, without which renewable capacity is stranded. Second, treat adaptation as equal in status to mitigation — drought-resistant crops, restored wetlands, climate-resilient road and drainage design in the hills, and early-warning systems. Third, price carbon-intensive choices honestly while protecting the poor from the consequences, since a transition perceived as unfair will not survive politically. Fourth, continue to press internationally for climate finance, because a country that has not caused a problem should not have to solve it alone.

The dilemma, then, is genuine but narrower than it appears. India cannot and should not

stop growing, and no responsible argument asks it to. What it can do is choose the technology of its growth, and here the interests of development and of the climate have converged more than they have diverged. A country that builds its next fifty years on imported fossil fuel will be poorer, sicker and more exposed than one that builds them on domestic sunlight. The question is not whether India can afford to act on climate change. It is whether it can afford the alternative.

Why this scores

Move	Where	Effect
Frames the topic as a genuine dilemma, not a slogan	¶1	Immediately sounds like analysis rather than an NCERT summary.
Thesis takes a position	¶1: conflict real short-term, false long-term	Avoids fence-sitting while remaining balanced.
Physical mechanism explained, not just asserted	¶2: warmer air holds more moisture → fewer heavier events	Explaining a mechanism reads as understanding. An engineer's advantage — use it.
Correct technical term deployed	¶3: <i>common but differentiated responsibilities</i>	One precise term is worth more than five vague ones.
Turn on the argument	¶4: <i>"Yet equity is an argument about who pays..."</i>	Shows you can distinguish two questions others conflate. High-value move.
Non-obvious supporting argument	¶4: energy security / import bill	Most candidates never get past "pollution is bad".
North-East paragraph, integrated not bolted on	¶5	Regional relevance plus a genuine analytical point (costs local, benefits national).
Four concrete, non-generic recommendations	¶6	Note "storage and grid capacity" — the specific detail that shows real knowledge.
Rhetorical inversion to close	last two sentences	Memorable without being florid.
Numbers avoided entirely	throughout	"fallen dramatically", "a large share" — every claim is safe.

Model Essay 4 — *Unemployment among the Educated Youth of Nagaland*

(Theme: economy + Nagaland · ~860 words · Skeleton B condensed to 6 paragraphs)

There is a particular kind of frustration that belongs to the educated unemployed. It is not the frustration of the person who never had a chance, but of the person who did everything that was asked — finished school, finished college, sat the examinations — and found at the end of it that the door which was supposed to open is not there. In Nagaland this experience has become common enough to shape a generation's outlook. This essay argues that educated unemployment in the state is not a failure of individual effort or even, principally, of education, but a structural mismatch between an economy with only one large employer and an education system built to supply that employer. It examines how the situation arose, why the usual remedies have underperformed, and what a realistic alternative would involve.

The origin of the problem lies in the shape of the state's economy. Nagaland is landlocked and mountainous, with a small internal market and high transport costs. Manufacturing has never established itself at scale, and agriculture, much of it still

practised as shifting cultivation on hill slopes, absorbs many households at low productivity and provides little surplus for reinvestment. The consequence is that the organised, salaried sector is dominated by government — departments, schools, the police, public undertakings. For a long period this worked well enough: government employment grew, and a college degree was a reasonable route into it. But a government payroll cannot grow indefinitely, and it has not. The number of graduates has continued to rise while the number of posts has not, and the gap between the two is precisely the problem.

Education has adapted to this reality in exactly the wrong way. When the only prize worth having is a government job, schooling and college orient themselves towards the qualifications and examinations that lead to it. General-degree enrolment is high; vocational and technical enrolment is comparatively low. Students acquire credentials rather than capabilities, and employers outside government — where they exist — complain of graduates who are literate, willing and untrained. There is also a social dimension. A government post carries prestige and security that private employment, especially manual or entrepreneurial work, does not, and families invest in the pursuit of that prestige. The result is a queue: young people spending years preparing for competitive examinations rather than entering a labour market they perceive as beneath their qualification. Every year spent in the queue is a year of skill not acquired.

The usual remedies have not been useless, but they have underperformed for identifiable reasons. Skill-development programmes have often trained people for trades for which there was no local demand, so that the trained migrate or return to waiting.

Self-employment and credit schemes founder where collateral is difficult, since land in Nagaland is largely held under community and customary tenure and is not readily mortgageable — a genuine constraint that arises directly from the land provisions protected under Article 371A, and one that deserves a designed solution rather than lament. And enterprise of any kind runs into the same physical facts that hold back everything else: unreliable power, roads damaged each monsoon, and freight costs that make it hard to sell outward.

What would a serious alternative look like? Four elements. **First, connectivity and power, treated as employment policy rather than as infrastructure policy.** No enterprise strategy survives an eight-hour outage or a road closed for three weeks; these are not background conditions but the binding constraint. **Second, sectors chosen for fit rather than fashion.** A landlocked hill state with high rainfall, forest cover and a young English-speaking population has real advantages in horticulture and organic produce, bamboo and allied processing, tourism built around the state's cultural distinctiveness, and remote-delivered services — the last requiring bandwidth and training rather than factories or ports, and therefore the most immediately achievable. **Third, credit that works with customary tenure rather than against it** — group guarantees, self-help-group lending, cooperative and community-backed instruments — so that the absence of mortgageable land stops being an absolute bar. **Fourth, a shift in what education produces**, with apprenticeship and vocational streams given genuine parity of esteem, and entrepreneurship taught as a practical subject rather than celebrated in speeches.

None of this is quick, and it would be dishonest to suggest otherwise. But the alternative — a growing cohort of qualified young people queueing for a shrinking number of posts — is not stable. Educated unemployment does not merely waste the public money already spent on schooling; it corrodes confidence in institutions and, where other outlets are absent, feeds substance abuse and disaffection. Nagaland has assets that many states lack: high literacy, dense and functioning community institutions, a distinctive culture with real economic potential, and constitutional protection for its land and custom. The task is to convert those assets from things to be preserved into things that generate livelihoods. That conversion is a matter of policy design and

sustained investment, not of exhorting young people to lower their expectations. They did what was asked of them. The economy now has to hold up its side of the bargain.

(≈860 words)

Why this scores

Move	Where	Effect
Human opening — a person, not an abstraction	¶1	Grips the examiner in the first two lines. Costs nothing to write.
Diagnostic thesis	¶1: "structural mismatch"	Names the problem precisely. The whole essay then earns that phrase.
Causal chain, not a list of complaints	¶2 → ¶3	Terrain → no manufacturing → govt is the only employer → education orients to govt → queue. Each paragraph causes the next. This reads as thinking.
A genuinely non-obvious insight	¶4: customary land tenure ⇒ no collateral ⇒ credit fails	Connects Article 371A to the credit market. Very few candidates make this link, and it is the strongest paragraph in the essay.
Explains why standard remedies failed	¶4	Far more sophisticated than "the government should do more".
Bolded four-part way forward	¶5	Scannable, specific, each tied to a constraint named earlier.
Honest about timescale	¶6 opening	"None of this is quick" — refusing to over-promise reads as maturity.
Closing that lands	last two sentences	Short, direct, morally serious, no cliché.
Zero invented numbers	throughout	Every claim is structural or qualitative.

3. Quotation bank

Use **one**, at most two, per essay. A quotation dropped in without connection to your argument scores nothing; one that opens or clinches a paragraph scores. Attribute correctly, or say "as the saying goes" and attribute to nobody.

On education and knowledge

Quotation	Attributed to
"Education is the most powerful weapon which you can use to change the world."	Nelson Mandela
"Knowledge is power."	Francis Bacon
"The function of education is to teach one to think intensively and to think critically."	Martin Luther King Jr.
"Educate a man and you educate an individual; educate a woman and you educate a family."	(widely quoted; attribution disputed — use as "it is often said that...")

On governance, justice and rights

Quotation	Attributed to
"Constitutional morality is not a natural sentiment. It has to be cultivated."	B. R. Ambedkar
"However good a Constitution may be, it is sure to turn out bad if those who are called to work it happen to be a bad lot."	B. R. Ambedkar
"Injustice anywhere is a threat to justice everywhere."	Martin Luther King Jr.
"Power tends to corrupt, and absolute power corrupts absolutely."	Lord Acton
"The best way to find yourself is to lose yourself in the service of others."	M. K. Gandhi
"Be the change you wish to see in the world."	<i>(popularly attributed to Gandhi; the exact wording is not verified in his writings — safe to use as "in the spirit of Gandhi's teaching")</i>

On freedom and nation

Quotation	Attributed to
"At the stroke of the midnight hour, when the world sleeps, India will awake to life and freedom."	Jawaharlal Nehru, 1947
"Where the mind is without fear and the head is held high..."	Rabindranath Tagore, <i>Gitanjali</i>
"Freedom is not worth having if it does not include the freedom to make mistakes."	M. K. Gandhi
"Arise, awake, and stop not till the goal is reached."	Swami Vivekananda

On environment and development

Quotation	Attributed to
"The earth has enough for everyone's need, but not for anyone's greed."	M. K. Gandhi <i>(commonly quoted in this form)</i>
"We do not inherit the earth from our ancestors; we borrow it from our children."	<i>(a proverb, often called Native American — attribute vaguely)</i>
"Development that meets the needs of the present without compromising the ability of future generations to meet their own needs."	Brundtland Commission, definition of sustainable development

On effort, science and change

Quotation	Attributed to
"Dream is not that which you see while sleeping; it is something that does not let you sleep."	A. P. J. Abdul Kalam
"Science is a way of thinking much more than it is a body of knowledge."	Carl Sagan
"The future depends on what you do today."	<i>(attributed to Gandhi; attribute vaguely)</i>

"It is not the strongest of the species that survives, but the most adaptable to change."

(commonly attributed to Darwin; he did not write it — use as "it has often been observed that...")

Safety rule: if you are not certain of an attribution, write *"as has often been said"* or *"in the words of an old proverb"*. A correct idea wrongly attributed is a visible error; an unattributed idea is not.

4. Opening patterns

Adapt these. Each is a *shape*, not a script.

#	Pattern	Template	Example
1	Historical anchor	"In [year], [person] [did/asked something]. [Contrast with today]."	"In 1950 Alan Turing asked whether a machine could think, and treated it as a question for the distant future."
2	Stark contrast	"India [impressive fact], and yet [troubling fact]."	"India sends missions to the Moon while a third of its children remain undernourished."
3	Definition	"[Term] means [plain definition]. But the word has come to carry more than that."	"Good governance means the exercise of public authority in a way that is lawful, accountable and responsive."
4	The paradox	"[X] is at once [A] and [B]."	"Nagaland is at once one of India's most literate states and one of its least industrialised."
5	The scene	"[Concrete image, one sentence.] [Zoom out to the general problem.]"	"Every monsoon, roads in the hill districts of the North-East that took three years to build vanish in a single night."
6	The question	"[Direct question]. The answer determines [large consequence]."	"Who should own the data that a citizen generates simply by living?"
7	The quotation	"'[Quote]', said [person]. [Apply to topic in one sentence]."	"'Knowledge is power,' wrote Francis Bacon — a claim that reads differently in an age of unlimited information."
8	The uncomfortable position	"[Country/state] occupies an uncomfortable position in [X]."	"India occupies an uncomfortable position in the world's climate arithmetic."
9	The human	"There is a particular kind of [emotion] that belongs to [group]."	"There is a particular kind of frustration that belongs to the educated unemployed."
10	The date	"[Place] became [X] on [date]. [Number] years later, [assessment]."	"Nagaland became the sixteenth State of the Indian Union on 1 December 1963."

Thesis-sentence templates (put one at the end of ¶1 — always):

- "This essay argues that X is not primarily a problem of A but of B."
- "The central contention of this essay is that the conflict between A and B is real in the short term but false in the long one."
- "It will be argued that X is neither a pure opportunity nor a pure threat, but an amplifier of the institutions that govern it."
- "This essay contends that the achievement has been A, and that the unfinished task is B."

Roadmap-sentence templates:

- "It examines the economic, social and governance dimensions in turn, before turning to the specific case of the North-East."
- "It considers first how the situation arose, then why the usual remedies have underperformed, and finally what an alternative would involve."
- "The discussion proceeds in four parts: context, causes, consequences and the way forward."

5. Closing patterns

#	Pattern	Template
1	Synthesis + condition	"The record is therefore mixed: [gain] alongside [gap]. Whether [X] proves [good] or [bad] depends less on [surface factor] than on [real factor]."
2	Refuse the false binary	"The task is not to choose between A and B — that framing has always been false — but to make A the instrument of B."
3	Rhetorical inversion	"The question is not whether we can afford to [act]. It is whether we can afford the alternative."
4	The agent named	"[The technology / the policy / the law] will not choose between these outcomes. We will."
5	The obligation	"They did what was asked of them. [The institution] now has to hold up its side of the bargain."
6	Image callback	Return in one line to the image you opened with, now transformed by the argument.
7	Conditional optimism	"There is reason for confidence, provided that [specific condition] is met. Without it, [X] will remain a statement of intent rather than a description of reality."
8	Quotation close	"[Person]'s warning that '[quote]' has lost none of its force." <i>(only if it genuinely fits)</i>

Never close with: "Thus we can conclude that...", "Last but not least...", "In a nutshell...", "Hence India will surely become a superpower by 20XX."

6. Connectives

Vary these. Repeating "moreover" five times is a visible weakness.

Function	Options
Adding	Moreover · Furthermore · In addition · Equally important · A second consideration is · What is more
Contrasting	However · Yet · Against this stands · By contrast · Nevertheless · On the other hand · That said · Even so
Conceding then turning	While it is true that X, ... · Granting that X, it remains the case that Y · X is real, but it is narrower than it appears
